

National Self Care Week

Newsletter – Second Edition

NHS Self Care Week
17-23 November 2014

Self care for life – be healthy this winter

Second **Self Care Week** Newsletter

Welcome to the second **Self Care Week** 2014 newsletter.

For those of you that are new to the concept of **Self Care Week** it is a national awareness campaign to promote the benefits of self care.

We hope you will get involved and build awareness amongst your audience to help improve levels of health literacy amongst the population.

 **Self Care Week**
17-23 November 2014

Self care for life – be healthy this winter

Self Care Week 2014

Self care for life – be healthy this winter

We choose a different theme each year for **Self Care Week** and because demand on health services increases in winter months, often due to weather related illnesses, this year's theme focuses on keeping well during winter.

There is also a need to help signpost people to the right service during winter as people are genuinely confused about where to go for their health needs.

Get involved

The purpose of this second newsletter is to remind you of the **material** that is available to you and highlight anything new, and provide **ideas** and **encouragement** for **Self Care Week**.

Available Material

- + Fact Sheets
- + Leaflets
- + Key messages (see slide 15)
- + Posters
- + Web buttons and banners
- + Sample press release / article

Material can be found at:

<http://www.selfcareforum.org/events/self-care-week/>

 **Self Care Week**
17-23 November 2014

Fact Sheets

Thirteen fact sheets are available on the Self Care Forum website to help you promote an understanding of how patients and the public can take care of their minor ailments at home or with advice from the pharmacist. Here are a few:

SELF CARE FORUM FACT SHEET NO. 1 (version 1.0.1.1)

Low Back Pain

This fact sheet helps you to know what's 'normal' and what you can expect to happen if you suffer from back pain. It also tells you when you should become concerned and seek advice from a health professional.

Useful facts

- What is low back pain? Low back pain describes aches, pains and/or stiffness in the lower back. It may come without a clear underlying cause.
- How common is low back pain? It's the most common form of back pain affecting 8 out of 10 people in the UK at some time in their life.
- Are my symptoms likely to be serious? No, low back pain usually lasts for 4 weeks and then improves. Most people get better in under a few days.
- Do I need to worry? Backs are made for twisting, bending over and lifting and get back to normal after 6 to 12 weeks plus some extra exercise.

What can I expect to happen?

- How long are my symptoms likely to last? Four weeks is likely to get better by itself within 12 weeks, and often earlier. But you may experience occasional twinges and aches for weeks and months.
- Do I need any medical treatment or surgery? Back pain usually gets better without medical treatment or surgery, with what is 'helpful' like a massage.
- Will I need further back? Some people do need to have an extra check.

What can I do myself to get better - now and in the future?

- Should I exercise? Simple back exercises, loosening your ankles, yoga and the Alexander technique can be helpful to ease back pain. See www.selfcareforum.org/low-back-pain/
- Keep moving. Avoid lying in bed and avoid sitting as far as possible, even if you're disabled. Use your bathroom lock, and when you expect to get better more quickly. Be careful and keep going, not do things you enjoy.
- Heat and cold. A hot bath or hot water bath can ease pain from some muscles, while cold from an ice pack or bag of frozen peas can help to ease sharp pain in the muscles.
- Medicine. Most of it is given in tablets and pills. There can be an increased risk of side-effects in the long term. Stronger medicines, such as opiates, are an additional option when simple ones are not working. Ask your pharmacist.

Self Care Forum

FACT SHEET NO. 11

Middle ear infection (acute otitis media)

This fact sheet helps you to know what's 'normal' and what you can expect to happen if your child develops an infection of the space behind the ear drum ('middle ear infection', or acute otitis media). It also tells you when you should become concerned and seek advice from a health professional. Middle ear infection usually affects children.

Useful facts

- What is middle ear infection? Behind the ear drum is a small space that's usually filled with air in the middle ear. To let air in and out, a small channel called the Eustachian tube connects this space to the throat. When germs (such as viruses or bacteria) enter during a cold, an ear infection can develop.
- How dangerous is it? In most children, otitis media is a harmless infection that gets better by itself without any complications.
- How common is it? Middle ear infection is very common, mostly affecting small children aged between six and 18 months. More than half of all children suffer at least one middle ear infection by the time they're seven.
- What are the symptoms? Older children usually complain of ear aches, while younger children often just cry or rub their ears. Other common symptoms include runny nose, a raised body temperature (fever), being irritable, crying, sleep problems, cough and poor feeding.
- Who's affected? Middle ear infections are more common in children who breathe in tobacco smoke, attend day care (nursery), or who drink formula milk rather than breast milk.
- Does my child need antibiotics? Most children with a mild middle ear infection will not benefit from antibiotics. Antibiotics can be useful in children younger than 2 years who have infections in both ears, or who have an infection together with a leaking ear.

What can I expect to happen to my child?

- Symptoms. Symptoms of middle ear infection tend to develop quickly and usually last an average of four days.
- Fluid leaking from the ear. A hole may form in the ear drum and cause infected thick fluid (pus) to run out of the ear. This usually relieves the pain as it reduces the pressure on the ear drum.

Self Care Forum
Produced by the Self Care Forum (www.selfcareforum.org). Last revised on 30 Oct 2013. Please contact Libby Whitaker 020 7421 9118 or email libby@selfcareforum.org with comments or suggestions.

FACT SHEET NO. 12

The common cold (adults)

This fact sheet helps you to know what's 'normal' and what you can expect to happen if you develop a cold. It also tells you when you should become concerned and seek advice from a health professional.

Useful facts

- What is the common cold? Most viral infections can cause symptoms of the cold, including a blocked and then runny nose, sneezing, cough, a sore throat, a slightly raised body temperature (fever) up to 39°C and feeling generally unwell.
- How dangerous are colds? Colds are harmless infections that in the vast majority of cases get better by themselves without any complications.
- How common are they? Colds are very common, and adults get an average of two to four colds a year.
- Are there any complications? While the symptoms are unpleasant, the common cold is harmless. Complications, such as chest, ear and other infections, are rare.
- Will I need antibiotics? Most colds get better on their own without treatment. Antibiotics are ineffective for treating the common cold and may cause side effects.
- Effect of smoking? Cold symptoms such as coughing tend to be more severe if you smoke, and the infection usually lasts longer.

What can I expect to happen?

- Symptoms. In adults and older children, cold symptoms last for about a week and a half, and in younger children for up to two weeks. Symptoms are usually worst in the first two to three days, before they gradually start to improve. Coughs may last up to three weeks.
- There is no cure. There is no cure for the common cold. But while our bodies fight the infection, there are various ways of relieving our symptoms.
- Catching a cold. We can catch a cold by either breathing in droplets of fluid containing the cold virus (before someone sneezes), or by touching something that someone has sneezed on, and then touching our mouth or nose.

Self Care Forum
Produced by the Self Care Forum (www.selfcareforum.org). Last revised on 30 Oct 2013. Please contact Libby Whitaker 020 7421 9118 or email libby@selfcareforum.org with comments or suggestions.

FACT SHEET NO. 13

Acute sinusitis (adults)

This fact sheet helps you to know what's 'normal' and what you can expect to happen if you develop sinusitis. It also tells you when you should become concerned and seek advice from a health professional.

Useful facts

- What are sinuses? Sinuses are cavities in our face bones that open up into the nose, helping to control the water content and temperature of the air reaching our lungs.
- What is sinusitis? The body's response to irritants or bugs (inflammation) can lead to sinusitis: a swelling and irritation of the lining of the sinuses. Viral infections, such as the common cold, can cause the lining of the nose to swell, blocking the small opening from the sinuses to the nose. Fluid inside the sinuses may build up, which can make you feel bunged up and stuffy.
- What types are there? Sinusitis can be acute (resolving within 12 weeks) or chronic (lasting longer than 12 weeks).
- What are the symptoms? The most common symptoms include a blocked or runny nose, pain and tenderness in the face, and a raised body temperature. Additional symptoms are headache, cough, pressure in your ears, feeling generally unwell, bad breath, tiredness, and reduced taste and smell.
- Will I need antibiotics? The symptoms of sinusitis usually get better on their own without treatment. Antibiotics are unlikely to help unless the symptoms are severe (see over the page).

What can I expect to happen?

- Duration. The symptoms of acute sinusitis last longer than the common cold and last about 2-3 weeks to clear. Chronic sinusitis may last for months.
- Need for treatment. In most people, sinusitis will get better without treatment, and about two thirds of people with sinusitis won't need to see their GP.

Self Care Forum
Produced by the Self Care Forum (www.selfcareforum.org). Last revised on 30 Oct 2013. Please contact Libby Whitaker 020 7421 9118 or email libby@selfcareforum.org with comments or suggestions.

SELF CARE FORUM FACT SHEET NO. 7 (version 1.0.1.1)

Cough in Adults

This fact sheet helps you to know what's 'normal' and what you can expect to happen if you develop a cough. It also tells you when you should become concerned and seek advice from a health professional.

Useful facts

- Types of cough. A cough may be acute, lasting less than three weeks, or chronic, when it may go on for more than eight weeks. Cough can also be dry or productive (spit up phlegm).
- Frequency. Most adults experience episodes of coughing between two and five times a year, and about one in five people suffer from coughing during the winter months.
- Acute versus chronic. Although coughing often impairs people's quality of life, it is rarely due to serious causes and usually gets better by itself.
- What causes cough? Acute cough is most commonly caused by a viral upper respiratory tract infection (URTI) due to a cold. A chronic cough is common in smokers and can sometimes suggest an underlying lung problem, but may also be caused by conditions outside the lung, such as heartburn (gastro reflux). Cough may also result from taking certain drugs (check the label), asthma, and environmental factors (dust, smoke, fumes, etc).

What can I expect to happen?

- Coughing is usually harmless. Although coughs can be distressing (both for yourself and others) and may be irritating to your eyes and throat because they often last for several weeks, acute coughs are almost always harmless and usually start to improve within three weeks.
- No need for antibiotics. Antibiotics do not work against viral infections, which cause most acute coughs, and so they may do more harm than good.
- Duration. You may usually suffer a dry cough for 3 to 6 weeks after an infection has settled.
- Tests. You don't normally need any tests if you suffer from an acute cough.

What can I do myself to get better - now and in the future?

- Try not to cough. Although this may sound easier said than done, you may be able to cough less often by trying not to cough, because our desire to cough can sometimes be influenced by our brain.

NHS
Supporting your independence and wellbeing with Telehealth and Telecare

Your health. Your Way. Your choice.

What if I don't want a care plan?
Many people with a long term condition feel more confident about managing their condition and prefer to get on with their lives as independently as they can. You might not want a care plan, which is fine, but you should still expect a regular discussion with your doctor, nurse or other health or social care professional about how you are managing your condition, and what you can do for yourself. You should also be listened to with your views taken into account and be given any new information that would be helpful. This is where the term "self care" might be used.

What does self care mean?
We all take care every day, without realising it, for example taking medicines properly and exercising. You can even improve your quality of life by setting your own goals such as stopping smoking, losing weight or even returning to work. Managing your condition better, means you will keep well for longer. Whatever you decide, your care planning discussion should include supporting you to self care.

How often will my care plan be reviewed?
This varies from person to person. It should be reviewed at least once a year, but more frequently if you and your doctor or nurse agree this is needed.

When managing long term conditions in children it is really important to monitor and revise the care plan to take account of growth and development.

Who owns your care plan?
It's your care plan and you own it. Many people have a paper copy that they take home with them but it's really up to you whether you want that or whether you just want it recorded in your notes. It's also confidential, therefore you can decide who has access to your plan such as your carer, family or health or social care professional.

What are the benefits of having a care plan?
Being able to talk about your condition and being listened to will help to ensure that you get the right services and are aware of the wider choices available to meet all of your needs, not just the medical ones. It will also help you to have a clear understanding of your medical condition and the impact it may have on your life.

Do you or your child have a long term condition?

Did you know a care plan will help you manage your condition better?

More Information
To find out more about care plans and the support available visit www.nhs.uk/yourhealth.
For other information on how to access NHS Services call NHS Direct on 0845 46 47. Carers can contact Carers UK via Carersline on freephone 0800 696 7777 or online at www.carersuk.org for support.
For tips on how to get the best out of a discussion with your doctor or nurse go to www.nhs.uk/yourhealth.
To find out more about the information Prescription visit: www.nhs.uk/informationprescriptions

Patient Advice and Liaison Service (PALS)
Whether you're a patient, relative or carer, PALS can answer questions and resolve concerns. Go on line at www.pals.nhs.uk or call NHS Direct to find out where your local PALS office is.

Is SCW on your website?

Another simple way of raising awareness about the campaign is to add a paragraph and image to your website. Below is some text to help you.

Self Care for Life – be healthy this winter

Did you know that it is usual for adults to have two to four colds a year while children are likely to have three to eight as their immune system is more susceptible to viral infections? That's why, during winter, when seasonal illnesses are more frequent, it is important to take extra measures to stay well.

As part of Self Care Week 2014, we are encouraging people to choose healthy lifestyle options that will impact positively on their physical health, mental wellbeing and self esteem. Help to maintain health and ward off illness by eating sensibly, stop smoking, drinking in moderation and taking regular exercise.

The Self Care Week message is “Self care for life – be healthy this winter” which we are supporting.

Don't be left out in the cold, understand how to look after your winter ailments

During Self Care Week [input your organisation name] want to support you to self care for life and understand how to take better care of yourself and your family members, especially during the winter months, when seasonal illnesses increase.

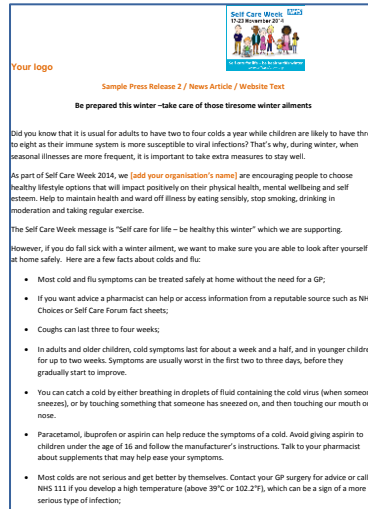

Preventing ill health is important during winter and so choose lifestyle options that will impact positively on your physical health, mental wellbeing and self esteem. To beat those winter blues and keep healthy make sure you eat well, drink in moderation, stop smoking and stay active.

It is usual for adults to have two to four colds a year while children are likely to have three to eight as their immune system is more susceptible to viral infections. If you do catch a winter ailment such as a cough, cold or sore throat, [grab your relief here](#) by keeping warm and drinking plenty of fluids. Over the counter medicines can help with symptom relief and a pharmacist can offer advice if you need it.

As well as pharmacy support, [NHS Choices](#) and the [Self Care Forum](#) can provide helpful information on common winter ailments such as coughs, colds, sore throats and fever in children. Generally, symptoms last longer than you might think and it is helpful to know what is normal and what isn't, Self Care Forum fact sheets can help with this. It is worth remembering also that antibiotics don't work on most winter illnesses like colds and flu as these are viral infections.

If you have a long term condition, prepare for winter by ensuring you don't run out of your medication, many pharmacists offer repeat prescription services without the need to see your GP.

Before you visit A&E, remember what it's there for. It provides vital care for life threatening emergencies, such as loss of consciousness, suspected heart attacks, breathing difficulties.

Be prepared this winter – take care of those troublesome winter ailments

Did you know that it is usual for adults to have two to four colds a year while children are likely to have three to eight as their immune system is more susceptible to viral infections? That's why, during winter, when seasonal illnesses are more frequent, it is important to take extra measures to stay well.

As part of Self Care Week 2014, we [add your organisation's name](#) are encouraging people to choose healthy lifestyle options that will impact positively on their physical health, mental wellbeing and self esteem. Help to maintain health and ward off illness by eating sensibly, stop smoking, drinking in moderation and taking regular exercise.

The Self Care Week message is "Self care for life – be healthy this winter" which we are supporting.

However, if you do fall sick with a winter ailment, we want to make sure you are able to look after yourself at home safely. Here are a few facts about colds and flu:

- Most cold and flu symptoms can be treated safely at home without the need for a GP.
- If you want advice a pharmacist can help or access information from a reputable source such as NHS Choices or Self Care Forum fact sheets;
- Coughs can last three to four weeks;
- In adults and older children, cold symptoms last for about a week and a half and in younger children for up to two weeks. Symptoms are usually worst in the first two to three days, before they gradually start to improve.
- You can catch a cold by either breathing in droplets of fluid containing the cold virus (when someone sneezes), or by touching something that someone has sneezed on, and then touching our mouth or nose.
- Paracetamol, ibuprofen or aspirin can help reduce the symptoms of a cold. Avoid giving aspirin to children under the age of 16 and follow the manufacturer's instructions. Talk to your pharmacist about supplements that may help ease your symptoms.
- Most colds are not serious and get better by themselves. Contact your GP surgery for advice or call NHS 111 if you develop a high temperature (above 39°C or 102.2°F), which can be a sign of a more serious type of infection;

Antibiotics Use

There is a growing need to educate people about the appropriate use of antibiotics. Here are two campaigns which have a wealth of resources for health professionals and for patients.

Public Health England has set up an antibiotic guardian page asking patients and health professionals to pledge to use antibiotics appropriately.

<http://antibioticguardian.com/>

RCGP TARGET provides clinicians with information on when to prescribe antibiotics and has a patient guide on "how to treat your infection". <http://www.rcgp.org.uk/clinical-and-research/target-antibiotics-toolkit/patient-information-leaflets.aspx>

Helping people take care of themselves

Self care for life – be healthy this winter

What is the Self Care Forum?

The **Self Care** Forum is the national UK organisation dedicated to helping people take care of themselves. Our aim is to further the reach of self care and embed it into everyday life, making it a life long habit and culture.

We provide support through material, case studies and campaigns to NHS agencies, the voluntary and the private sector to help them deliver self care education and messages to their target audiences whether they are patients, staff or the public.
